Practice : 2

In [1]:

```
input_features, hidden_neurons, output_neurons = 3, 4, 1
dropout_rate = 0.5

total_weights = (input_features * hidden_neurons) + (hidden_neurons * output_neu
active_neurons = hidden_neurons * (1 - dropout_rate)

print(f"Total weights = {total_weights}")
print(f"Active neurons after dropout = {active_neurons}")

X = [2, 6, 10, 14]
mean = sum(X) / len(X)
variance = sum((x - mean) ** 2 for x in X) / len(X)

print(f"Mean = {mean}")
print(f"Variance = {variance}")
```

```
Total weights = 16
Active neurons after dropout = 2.0
Mean = 8.0
Variance = 20.0
```
